Health data access that explains itself

An automated Health Data Access Body for the European Health Data Space

HalfSecuredTeam · Track 3 · Regulation (EU) 2025/327

THE PROBLEM

Weeks of waiting, two kinds of people

Researchers

know the medicine and the question — not how to query a database

Engineers

write the query — but not the medical codes, nor whether the purpose is lawful

The access body

must check every request against the regulation and protect patients

We sit at the intersection.

OUR APPROACH

Four ideas

Law-grounded AI

picks the article and quotes it

Words → SQL by rules

no query written per request

Privacy inside the query

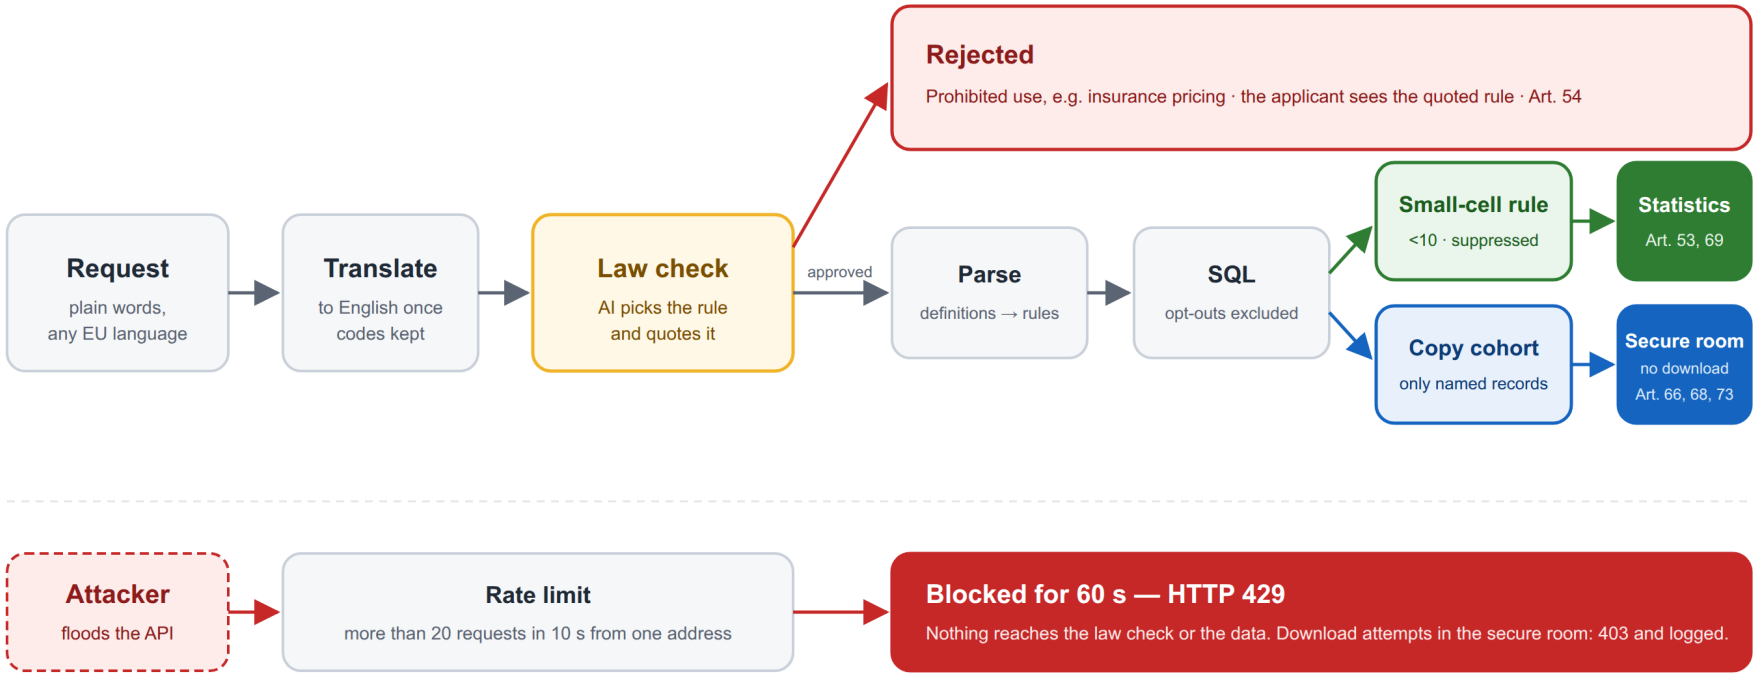

small cells and opt-outs cannot leak

Secure room, no exit

records viewed as images, never downloaded

HOW IT WORKS

One pipeline, three outcomes

Patient data never leaves the app. The AI only ever sees the request text and the law.

Demo

Four requests and one attack

R02 rejected · R01 statistics · R11 in German · R12 secure room · flood blocked

HONEST SUMMARY

What works — and what does not yet

Works

- 10 / 10 decisions and articles
- 6 / 6 numbers, 0 privacy leaks
- 10 / 10 consistent across 3 runs, 5.7 s
- 34 / 36 unseen requests, incl. German
- Secure room: images only, download 403

Not yet

- Sometimes too strict when a study mentions a prohibited topic
- Cited point within Art. 53 can vary
- Staff submission list is a placeholder
- Screens can be photographed — true of every SPE
